Problem 1

For each of the following scenarios, choose Φ1 and Φ2 so that the resulting AR(2) process is causal. In each case use R to plot ACF and PACF of the AR(2) process and discuss the characteristics of the plots. (i) Φ1 > 0 and Φ2 > 0 (ii) Φ1 < 0 and Φ2 > 0 (iii) Φ1 > 0 and Φ2 < 0 (iv) Φ1 < 0 and Φ2 < 0

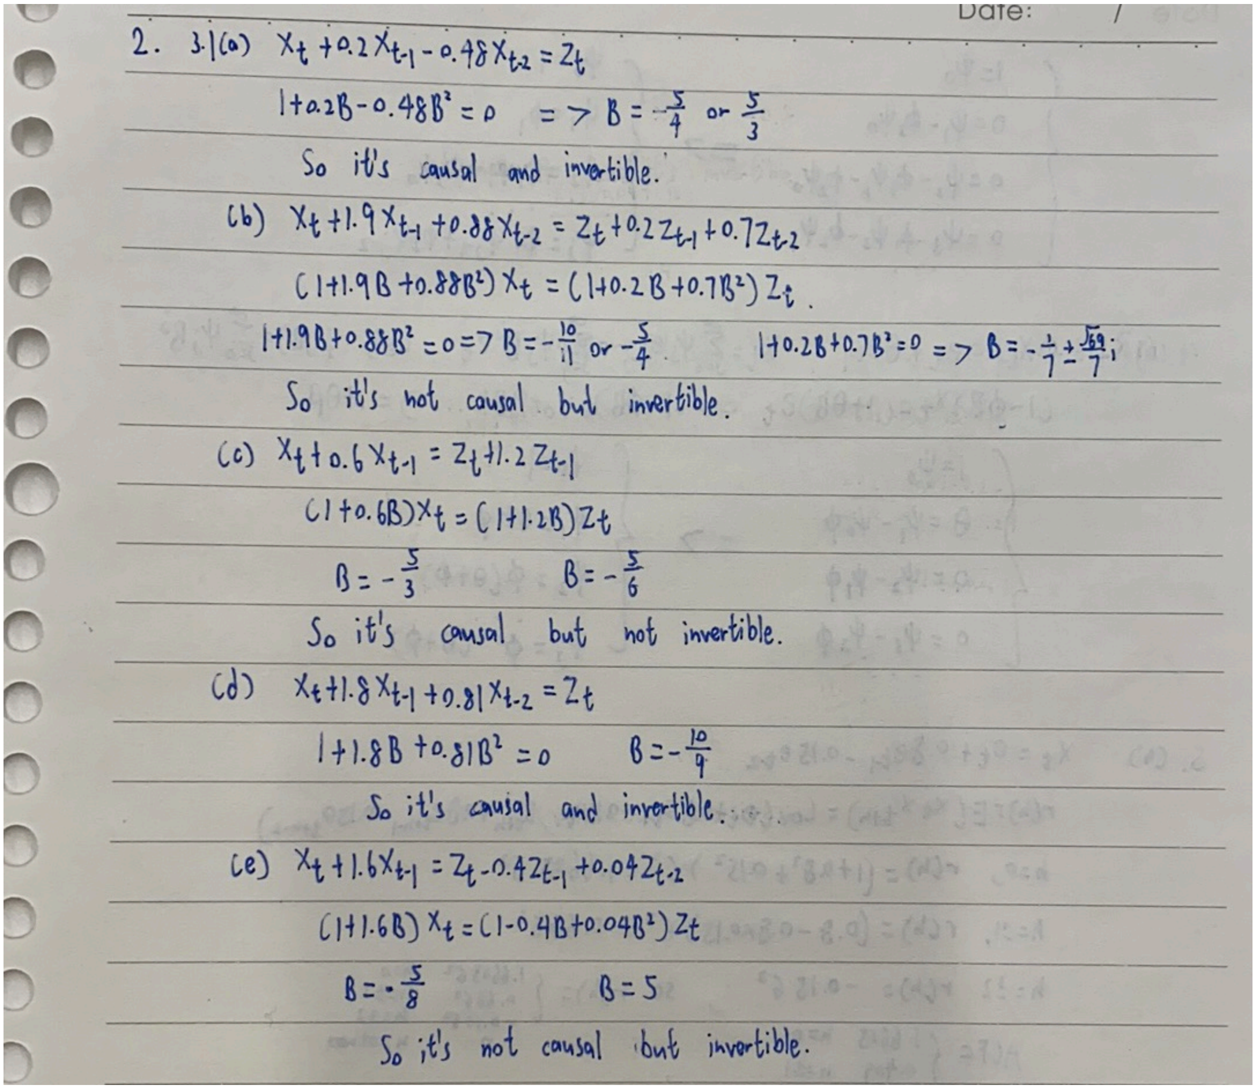
A: Two cases the ACF are always positive and the other 2 is half positive and half negative. There are only two lines in PACF which implies that when h>2, the PACF is 0.

Problem 2

3.1



Date: /

2. 3.1(a) $X_t + 0.2X_{t-1} - 0.48X_{t-2} = Z_t$

$1+0.2B-0.48B^2=0 \Rightarrow B = -\frac{5}{4}$ or $\frac{5}{3}$

So it's causal and invertible.

(b) $X_t+1.9X_{t-1}+0.88X_{t-2} = Z_t+0.2Z_{t-1}+0.7Z_{t-2}$

$(1+1.9B+0.88B^2)X_t = (1+0.2B+0.7B^2)Z_t$.

$1+1.9B+0.88B^2=0 \Rightarrow B=-\frac{10}{11}$ or $-\frac{5}{4}$. $1+0.2B+0.7B^2=0 \Rightarrow B = -\frac{1}{7}\pm\frac{\sqrt{69}}{7}i$

So it's not causal but invertible.

(c) $X_t+0.6X_{t-1} = Z_t+1.2Z_{t-1}$

$(1+0.6B)X_t=(1+1.2B)Z_t$

$B=-\frac{5}{3}$ $B=-\frac{5}{6}$

So it's causal but not invertible.

(d) $X_t+1.8X_{t-1}+0.81X_{t-2}=Z_t$

$1+1.8B+0.81B^2=0$ $B=-\frac{10}{9}$

So it's causal and invertible.

(e) $X_t+1.6X_{t-1} = Z_t-0.4Z_{t-1}+0.04Z_{t-2}$

$(1+1.6B)X_t=(1-0.4B+0.04B^2)Z_t$

$B=-\frac{5}{8}$ $B=5$

So it's not causal but invertible.

For those processes in Problem 3.1 that are causal and invertible, compute and graph their ACF and PACF using the program R.

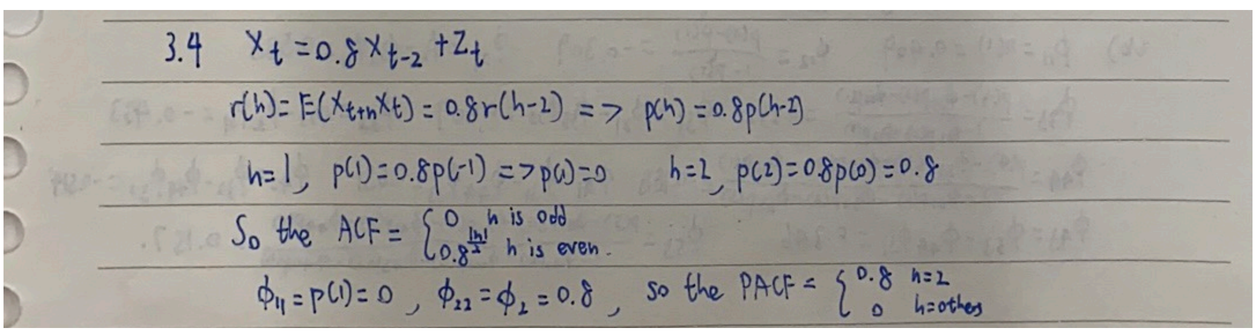
3.4



3.4 $X_t = 0.8X_{t-2} + Z_t$

$r(h) = E(X_{t+h}X_t) = 0.8r(h-2) \Rightarrow \rho(h) = 0.8\rho(h-2)$

$h=1$, $\rho(1) = 0.8\rho(-1) \Rightarrow \rho(1) = 0$ $\quad h=2$, $\rho(2) = 0.8\rho(0) = 0.8$

So the ACF $= \begin{cases} 0 & h \text{ is odd} \\ 0.8^{\frac{|h|}{2}} & h \text{ is even.} \end{cases}$

$\phi_{11} = \rho(1) = 0$, $\phi_{22} = \phi_2 = 0.8$, so the PACF $= \begin{cases} 0.8 & h=2 \\ 0 & h=\text{others} \end{cases}$

Problem 5

5. (a) $X_t = e_t + 0.8e_{t-1} - 0.15e_{t-2}$

$r(h) = E(X_t X_{t+h}) = Cov(e_t + 0.8e_{t-1} - 0.15e_{t-2}, e_{t+h} + 0.8e_{t+h-1} - 0.15e_{t+h-2})$

$h=0, \quad r(h) = (1+0.8^2+0.15^2)\sigma^2 = 1.6625\sigma^2$

$h=\pm1, \quad r(h) = (0.8 - 0.8\times0.15)\sigma^2 = 0.68\sigma^2$

$h=\pm2 \quad r(h) = -0.15\sigma^2$, so $r(h) = \begin{cases} 1.6625\sigma^2 & h=0 \\ 0.68\sigma^2 & h=\pm1 \\ -0.15\sigma^2 & h=\pm2 \\ 0 & h=\text{others} \end{cases}$

Problem 6

(a)

A:By looking at the plot, I know that it's a AR(2) model, and according the plot of PACF, Φ22=Φ2=-0.2, so Φ2=-0.2, and Φ11=Φ1/(1-Φ2)=0.75, so Φ1=0.9,and I plot this model and it looks the same.

```r

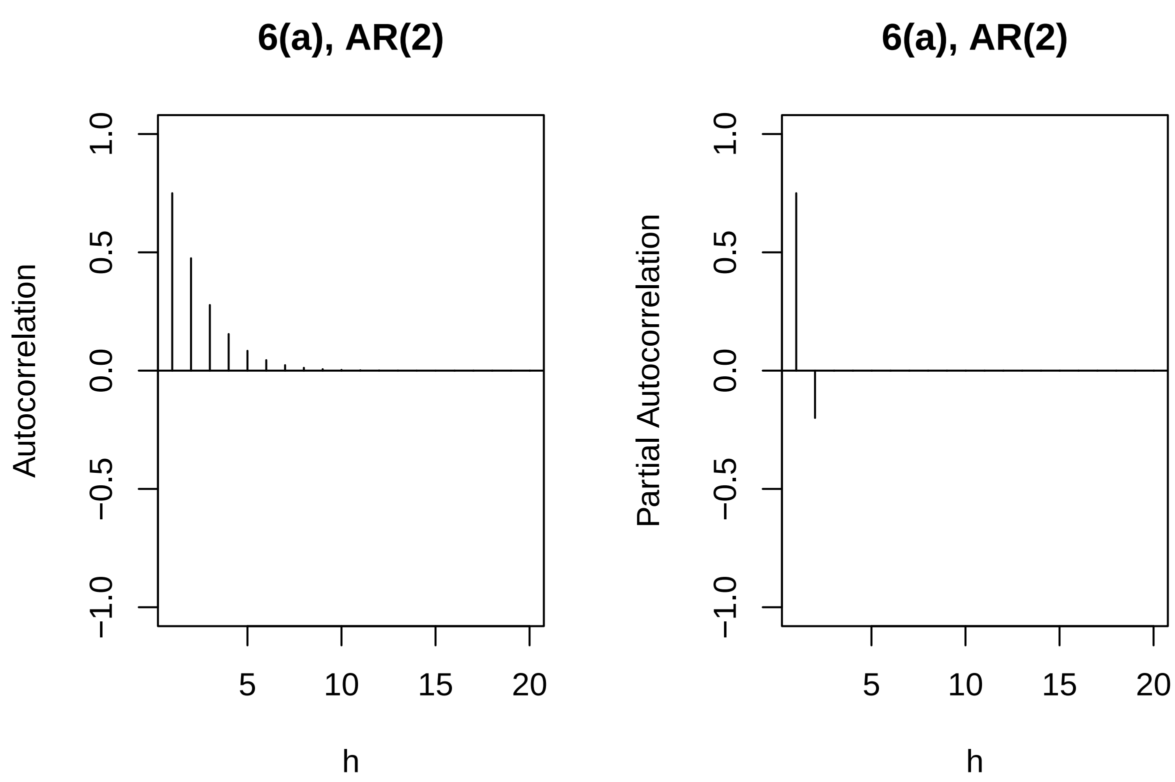
plot(y, x = 1:20, type = "h", ylim = c(-1,1), xlab = "h", ylab = "Partial Autocorrelation", main = "6(a
abline(h = 0)
```



(b)

A:By looking at the plot, I know that it's a MA(1) model, and according the plot of ACF, p(1)=$\theta/(1+\theta\hat{}2)$=-0.4, so θ=-2or -0.5,,and I plot this model and it looks the same.
